

FAZON Record — Evidence Traces v1

Record ID: FAZON-REC-2026-02-02-EVIDENCE-TRACES-v1

This evidence pack provides three synthetic, public-safe examples of decision traces aligned to the Execution Envelope concept.

No thresholds or internal endpoints are disclosed. All artifact hashes in the examples are deterministic placeholders.

Example 1 — HOLD (blocked)

State coherence/drift constraint family failed. Execution deferred (fail-closed). Evidence answers: why not now.

Example 2 — FRAGMENT (partial)

Comms constraint family failed. Only safe local subset executed; remote/irreversible steps deferred. Evidence answers: why not full now.

Example 3 — SEND (executed)

All constraint families passed. Execution proceeded within constrained scope with captured evidence artifacts.

Schema (public-safe)

See `evidence_trace_schema.json` for the trace structure. Fields include envelope outcomes per constraint family, execution mode, authority context, and artifact hashes.
