

**FAZON**

GOVERNED EXECUTION FOR AI SYSTEMS

ZENODO VERSION 0.2

AI EXECUTION GOVERNANCE

THE PRE-EXECUTION ACTION ADMISSIBILITY LAYER

A Bounded Category Position Addendum to
Permission Before AI Action Becomes Consequence

SECTOR

Enterprise AI Security and Governance

CATEGORY

AI Execution Governance

SUBCATEGORY

Pre-Execution Action Admissibility

GOVERNED OBJECT

THE SPECIFIC PROPOSED ACTION**DECISION MOMENT: BEFORE EXTERNAL OR BINDING CONSEQUENCE****PERMISSION BEFORE AI ACTION BECOMES CONSEQUENCE****NO PROOF -> NO BIND -> NO SIDE EFFECT**

Executive statement

Version 0.1 defined the bounded public question: **before a specific proposed AI-driven action becomes an external or binding consequence, do the current authority, scope, evidence, permission, accountability, and consequence conditions still fit that action?** Version 0.2 does not broaden that question. It fixes its public placement within an enterprise taxonomy and identifies the governed object and decision moment more precisely.

Canonical FAZON position

Sector: Enterprise AI Security and Governance

Category: AI Execution Governance

Subcategory: Pre-Execution Action Admissibility

Governed object: the specific proposed action

Decision moment: before external or binding consequence

This addendum is conceptual and diagnostic. It does not claim that these labels are an adopted industry taxonomy, technical standard, certification scheme, legal classification, trademark monopoly, or proof of production implementation. It does not claim that FAZON is the first, only, or unique use of the general terms execution governance, admissibility, permission, or consequence.

1. Purpose and relationship to Version 0.1

- Fix the public hierarchy in which the FAZON bounded question sits.
- Name the governed object: the specific proposed action under present conditions.
- Name the decision moment: immediately before an external or binding consequence may occur.
- Separate the FAZON subcategory from adjacent security, policy, assurance, monitoring, reporting, and audit functions.
- Preserve the public disclosure boundary and all non-claims established in Version 0.1.

Version relationship. Version 0.1 remains the immutable base public record at DOI 10.5281/zenodo.21497719. This Version 0.2 document is a bounded category-position addendum issued under Zenodo DOI 10.5281/zenodo.21833626 and linked to the version family under Concept DOI 10.5281/zenodo.21497718. It does not retract or silently rewrite the earlier note; it narrows the public taxonomy and should be read with the base record.

2. Canonical category hierarchy

FAZON PUBLIC CATEGORY HIERARCHY

2.1 Sector: Enterprise AI Security and Governance

The sector names the broad enterprise context in which organizations manage AI-enabled risk, security, authority, accountability, assurance, oversight, and operational effects. It is not a legal sector classification and does not imply that every FAZON use case is regulated in the same way.

2.2 Category: AI Execution Governance

The category concerns governance of AI-enabled actions as they move from recommendation, proposal, routing, tool invocation, or workflow continuation toward operational consequence. It is narrower than AI governance in general and broader than any single use case, technology, or control implementation.

2.3 Subcategory: Pre-Execution Action Admissibility

The subcategory names the current, action-specific decision layer immediately before a proposed action may create an external or binding effect. In this public use, admissibility means fitness to proceed under current governance conditions. It is not a court-evidence term, a legal opinion, or a compliance determination.

Public working definition

Pre-Execution Action Admissibility is the current determination of whether a specific proposed AI-driven action may proceed to a specific consequence under the authority, evidence, scope, context, target, and consequence conditions that apply now.

3. The governed object and the decision moment

3.1 The governed object is the specific proposed action

The public object is not AI in the abstract, not a permanent permission attached to an agent, not a policy document in isolation, and not a prior approval that travels indefinitely. It is the specific proposed action under present conditions.

A public diagnostic description of the action may ask:

- What exactly is proposed?
- Who or what is proposing or invoking it?
- Which target, destination, person, record, resource, or system will be affected?
- Which current authority, purpose, scope, and evidence support it?
- What external or binding consequence can it create?
- What has changed since any earlier approval or review?
- Can the consequence still be paused, refused, redirected, or escalated before commitment?

These are diagnostic dimensions, not a disclosure of a FAZON schema or state model.

3.2 The decisive moment is before consequence

The subcategory is located before a proposed action crosses into an external communication, record mutation, access change, transaction, deployment, commitment, release, or other binding operational effect. The decision must remain challengeable while intervention can still causally change what happens next.

Canonical question

May this specific proposed AI-driven action create this specific consequence now, under current authority, evidence, scope, context, target, and consequence conditions?

4. Where the subcategory sits

The surrounding functions are necessary and may provide decisive inputs. They are not interchangeable with the current action-specific determination.

Adjacent function	Primary question	FAZON distinction
Capability	What the system can do.	Capability is not authority.
Identity and access	Who may reach a model, tool, resource, or system.	Access is not permission for the resulting consequence.
Governance source or policy	What rules, obligations, controls, or conditions exist.	A rule that exists may not be current, applicable, or sufficient for this action.
Evidence and assurance	What was examined, mapped, tested, accepted, or preserved.	An evidence package is an input; it is not current action permission.
Monitoring and observability	What state, signals, behavior, or changes are visible.	Visibility can trigger review; it does not itself decide whether the action may proceed.
Audit log or receipt	What was decided or what happened.	A record supports accountability; it does not retroactively create prior permission.

5. Category-level chain

Public chain - not an implementation diagram

CURRENT GOVERNANCE BASIS + CURRENT ACTION CONTEXT

- > SPECIFIC PROPOSED ACTION
- > PRE-EXECUTION ACTION ADMISSIBILITY
- > CONSEQUENCE OR NO SIDE EFFECT
- > EVIDENCE-GRADE RECEIPT

The chain states a public governance proposition. It does not disclose how FAZON represents authority, computes a decision, prevents bypass, binds a decision to an effect, structures a receipt, or writes canonical state.

5.1 Core public non-equivalences

- Capability is not authority.
- Identity or access is not action-specific permission.
- A policy that exists is not proof that it is currently applicable.

- A point-in-time evidence package is not current action admissibility.
- Monitoring and observability are not a pre-action decision.
- Auditability and receipts are not prior authorization.
- A recorded non-permit outcome is not, by itself, proof that no side effect occurred.
- Local step validity is not aggregate consequence admissibility.

6. What this category position does not absorb

The subcategory is intended to connect to adjacent enterprise controls without relabeling them as FAZON or treating them as incomplete versions of the same architecture.

Not equivalent to	Boundary
IAM / IdP / PAM	Identity, authentication, privilege, and access management remain distinct control domains.
DLP / SIEM / EDR / security monitoring	Detection, containment, telemetry, and security response remain distinct.
Generic policy engine	Policy evaluation can be an input; the category is not defined as one vendor or rule-engine product.
Model evaluation or red teaming	Quality and safety evaluation do not independently authorize a later operational action.
Incident or flaw reporting	Reporting and routing help remediation after discovery; they do not decide the next action before consequence.
Point-in-time assurance package	Historical evidence and reviewer acceptance do not automatically remain current authority.
Audit log or interaction receipt	Post-event evidence supports accountability but is not a substitute for the pre-action decision.
Certification or legal compliance scheme	This public category position does not certify, interpret law, or establish conformity.

7. Public claim boundary

Claim	Status	Public interpretation
Sector / category / subcategory position	YES	Fixed and asserted as the FAZON public position in this addendum.
Governed object and decision moment	YES	The specific proposed action before external or binding consequence.
Public diagnostic distinctions	YES	Adjacent functions are distinguished from current action-specific permission.
Category-level chain	YES	Conceptual placement only.
Industry-standard taxonomy	NO	No industry adoption, consensus, or standardization claim.
First / only / unique use of generic terms	NO	No priority monopoly claim over generic vocabulary.
Trademark ownership of generic category terms	NO	No such claim in this document.
Implementation architecture or schema	NO	Not disclosed or claimed.
Production deployment or non-bypassability	NO	Not demonstrated by this addendum.
Certification, regulatory conformity, or legal compliance	NO	Not claimed.
Operational consequence custody	NO	Not claimed.
Guaranteed no-side-effect outcome	NO	The public formula is a governing principle, not operational proof.
Vendor integration, partnership, or endorsement	NO	Not claimed.

8. Canonical public wording

Public position

FAZON operates within Enterprise AI Security and Governance. Its category is AI Execution Governance. Its bounded subcategory is Pre-Execution Action Admissibility: permission for the specific proposed action before that action becomes external or binding consequence.

Public formula

Permission before AI action becomes consequence.
No proof -> no bind -> no side effect.
